

Scenario:

You are a young worker who has to use a bike to commute to work every day. While at work you're often concerned about your bike being stolen or forgetting where you have left it. You decide to use a bike tracking app to keep your mind at ease.

Task 1: Create an account in the app

Task 2: Register your bike through the app.

Task 3: Get directions to your bike.

Notes:

Changes:

- Create a more interactive registration screen with a password and an email option.
- Add a back button
- How is the bike really connected to the app? Is there some kind of device that needs to be bought in order to really keep your bike safe?

Things to keep the same:

- Maps are a good feature.
- Bike stats.
- Option for more than one bike.
